Project Name	Laptop Request Catalog Item
Maximum Marks	4 Marks

Empathy Map Canvas:

In the *Empathize & Discover* phase, the team studies how employees and IT administrators manage laptop requests within the organization. They observe that employees often feel frustrated by the slow, manual process and unclear steps, while administrators struggle with incomplete or inaccurate request details. Through interviews and feedback sessions, the team discovers that these challenges lead to repeated follow-ups, delayed approvals, and decreased productivity.

By understanding these real pain points, the team recognizes the need for a guided, automated Service Catalog form with dynamic fields, validation checks, and reset options. These insights highlight that a smoother, more transparent workflow will not only save time but also improve user confidence and operational efficiency.

Example:

The empathy map helped us understand the challenges faced by employees and administrators during the laptop request process. It revealed their frustrations with manual submissions, delays, and lack of clarity, as well as their need for a more guided and efficient system. These insights guided us to design an automated Service Catalog solution with dynamic fields, validations, and reset options—ensuring a faster, error-free, and more user-friendly laptop request experience.

Example: Manual Laptop Request

By deeply understanding users through empathy mapping, we uncovered key frustrations and inefficiencies in the manual laptop request process. Employees struggled with unclear procedures, missing information, and long approval times, while administrators faced repetitive verification tasks and data inconsistencies. These insights highlighted the need for automation, clarity, and user guidance. Consequently, we designed an intelligent ServiceNow Service Catalog system featuring dynamic fields, validation checks, reset options, and real-time tracking. This ensures accurate submissions, faster approvals, and greater transparency—ultimately improving efficiency, accountability, and user satisfaction in the laptop request workflow.
