

Project Design Phase
Solution Architecture

Date	
Team ID	NM2025TMID05911
Project Name	Laptop Request Catalog Item
Maximum Marks	4 Marks

Solution Architecture:

Goals of the Architecture:

- Automate the laptop request process through a dynamic Service Catalog form
- Ensure accuracy, completeness, and governance in asset request workflows
- Enhance user experience and reduce manual intervention for both employees and IT admins

Key Components:

- Service Catalog Item – Laptop Request Form created in ServiceNow
- Catalog Client Script – Enables dynamic field behavior based on user selections
- UI Policy – Controls field visibility and mandatory settings dynamically
- Update Sets – Track and manage all configuration changes for deployment and governance

Development Phases:

1. Design the catalog item with required fields (Employee Name, Department, Laptop Type, Justification, etc.)
2. Implement client scripts and UI policies for dynamic responses and validations
3. Add reset functionality for form reinitialization
4. Test end-to-end workflow including form submission, approval, and record generation

⊗ **Solution Architecture Description:**

The solution architecture focuses on transforming the manual laptop request process into a streamlined, automated workflow within ServiceNow. A custom Service Catalog item serves as the central interface for employees to submit laptop requests, supported by client scripts and UI policies that dynamically adjust fields and validations based on user input. The system ensures accurate data capture and a guided experience while allowing users to reset and re-enter information easily. Update sets record every configuration change, ensuring governance and traceability during deployment. This architecture minimizes manual workload, accelerates approval processes, and improves overall efficiency and transparency in IT asset management.
